

### ULTRA

---

- The new standard for charged-particle detector spectroscopy
- Ultra-thin entrance contact for optimum energy resolution
- High geometric efficiency due to close detector-to-can spacing
- Rugged and reliable
- Gold-plated cans for contacts that last a lifetime
- Advanced surface passivation for total device stability
- ORTEC quality and reliability
- Bakeable at 200°C (require special order)

### ULTRA-AS

---

- Low-background version for alpha spectroscopy

ULTRA ion-implanted-silicon detectors for alpha and beta spectroscopy are the most advanced charged-particle detectors ever produced. They possess the reliability that has made ORTEC the sole supplier to NASA of silicon detectors for space applications.

Both the entrance and the back contact are ion implanted. The entrance contact is an extremely thin (~500 Å) boron implantation. Since no epoxies are used to mount the ULTRAS, the distance between the silicon surface and the top of the mounting can is <1 mm; this provides maximum geometric efficiency. The rugged front contact, easily cleaned with a solvent-moistened cotton swab, is impervious to finger contact.

ULTRA detectors have **gold**-plated mounting cans. The superior electrical conductivity of gold, which can never oxidize, makes it the choice vs. stainless steel or aluminum. Gold contacts last a lifetime. An advanced surface passivation that covers the critical silicon dioxide layer guarantees absolute device stability.

The extremely low leakage current permits specifying the energy resolution at a 1-μs amplifier time constant.

Low-background ULTRA-AS detectors are made with special low-background materials and have an optimized depletion thickness to minimize background counts from cosmic rays. All ORTEC Alpha Spectrometers (OCTÊTE Plus, 576A, and SOLOIST) are equipped with either ULTRA-AS detectors or R-Series, Ruggedized Surface Barrier Detectors. All these spectrometers, when equipped with a 450 mm<sup>2</sup> detector, have a warranted background performance of ≤24 counts per day, over the 3- to 8-MeV energy range.

The dimensions of the ULTRA and ULTRA-AS detector mounting cans, identical to those of the corresponding size A or R Series detectors, ensure that ULTRA detectors will fit perfectly in any application where A or R Series detectors are being used now.

NOTE: Extensive care regarding detector and chamber cleanliness can result in background count levels as low as 0.05 counts/hr/cm<sup>2</sup> of active area, corresponding to 6 counts/24 hours, for a 450 mm<sup>2</sup> active area.

## Ion-Implanted-Silicon Charged-Particle Detectors

### Mounting Arrangements

**B** Microdot connector on the rear of the can.

**C** BNC connector on the rear of the can.

**T** Microdot on the side of the can; without adjustable screws. Available only for 300-, 450-, and 600-mm<sup>2</sup> detectors, except by special order.

For ULTRA or ULTRA-AS detectors in 576A Alpha Spectrometer modules having a horizontal sample tray, only one side of the can has an opening.

V, W, X, Y, and Z dimensions are given in millimeters.

§Built into a Microdot connector only.
