

- Optimum performance for charged-particle or heavy-ion detectors requiring high bias voltage with capacitances of up to 100 pF
- Extremely low noise
- Accepts 0 to  $\pm 5$  kV bias
- Separate fast-timing output signal with rise time from  $< 5$  ns

The ORTEC Model 142AH Preamplifier was designed to meet the needs of experimenters who require optimum performance from their charged-particle or heavy-ion detectors. This requirement is satisfied by the charge-sensitive Model 142AH through its extremely low noise and fast-timing characteristics. It is particularly suitable for high-energy charged-particle spectroscopy where high-resolution detectors with capacitances of up to 100 pF and bias voltages of up to 5000 V are involved.

Model 142AH has a separate fast-timing output signal approximately 50 ns wide with rise times ranging from  $< 5$  ns for 0 pF detectors to  $< 12$  ns for 100 pF detectors. This feature enables it to be directly coupled to a timing discriminator for some applications.

When the Model 142AH is used in conjunction with ORTEC's standard electronics, excellent timing resolution is obtained (Fig. 1).
